PROFILE

Software developer focused on backend systems, APIs, automation and web products. I work from problem definition through data, rules, implementation and validation, with a preference for systems that can be explained, tested and improved.

SELECTED PROJECTS

Lumina Skin

FastAPI / Python / SQLite / React / TypeScript / Pytest / GitHub Actions

AI-assisted skin analysis API. Generative models interpret photo/text input while deterministic backend rules own product compatibility and ranking. Repository documents 59 automated tests and CI across backend and web clients.

Ponto Comum

HTML / CSS / JavaScript / Accessibility / VLibras

Academic accessible-web prototype with keyboard navigation, semantic structure, skip link, text scaling, high contrast, highlighted links, reduced motion and persisted user preferences.

Bella Napoli

FastAPI / Pydantic / SQLAlchemy / PostgreSQL

In-development ordering system focused on the flow between customer conversation, backend state, relational data and operational tooling.

Inventory System

Database modelling / Business rules

Inventory project centered on business meaning and stock rules, including continuous quantities measured in meters. Current direction is a solo rebuild with full ownership.

CURRENT STACK

Python / FastAPI / Pydantic

SQLAlchemy / PostgreSQL / SQLite

React / TypeScript / JavaScript

HTML / CSS / Accessible web

Pytest / GitHub Actions / Git & GitHub

EDUCATION

Systems Analysis and Development - in progress. Current studies include programming, databases, software engineering and web development.
